#	Issue	Comments
	Readme	
1	Add a command to clone a project	There should always be a command in the readme file to clone the project so that any user knows how to copy your project.
2	It is not clear where it needs to change the **Password** and **Username**	The customer will not climb the project (especially if it has a lot of tests and pages). Therefore, we add the path to the file in which we need to enter our data.
3	No command to run Cypress GUI	Commands to run the project in the **headed** and **headless** modes need to be added
4	The readme file has no title for project's features	
5	The readme file has no info on how to generate allure report or open it locally	
6	The readme file has no link to github pages	
	Pages	
1	The variables and classes naming issues	1.Use the camelCase correctly, when naming the variables (signoutLink -> signOutLink) 2. Use the PascalCase for the class names (loginPage -> LoginPage)
2	**loginPage.ts**	To remove "emailId: string" and etc, add "noImplicitAny": false in "**compilerOptions**" in "tsconfig.json"
3	Line 4	**signinLink** should belong to the **main page** which will be inherited by other pages
	Gitignore	
1	.gitignore not being used correctly	1.Repeat folder names (**reports/**** and **reports**) 2. **cypress/downloads** doesn`t exist 3. **videos** and **screenshots** folders already in **reports** folder
	cypress.config.ts	
1	Add a command to make allure reporter work every run	
	package.json	
1	After implementing the fix in the config, remove the commands for allure	
	Test	
1	Tests need to be numbered	Add numbering to tests, because the lack of numbering leads to confusion
2	Delete unused imports	
3	MyAccount.test.ts is an irrelevant test	The Test does not test declared functionality. Instead, a dummy test is used.
	login.test	
1	Line 12	Don't enter the date manually if it is already in **users.json**
3	Lines 11-16	Lines 11-16 can be removed since lines 17-22 perform exactly the same functions
4	In each of the "**it**" description "read data from fixture" can be removed	
	Lines 14,15,20,21	Lines contains irrelevant code (the checks do not correspond to the tests purpose)
	Line 34	Does not have a new line before password argument like in previous tests
	Line 35	Wrong error message ('**Invalid email addressssss.**')

	users.json	
1	Wrong data name	Naming variables "**invalid**_password" and "**invalid**_email" Is incorrect if the array is similarly named "**invalid**_credentials"
2	Fixutes file contains duplicated test data. The structure of the test data is overcomplicated	File contains duplicated test data. The structure of the test data is overcomplicated
	Project structure	
2	Docs folder contains useless files	Everything in the docks folder is generated by the command **"allure:generate"**
3	**config.config.ts** is incorrectly named	Better to name this file **cypress.config.ts**
4	**commands.js** and **e2e.js**	Why are there **.js** files if the same **.ts** files will be installed after running command "**npm i**"
